

# 工程數學--微分方程

## Differential Equations (DE)

授課者：丁建均

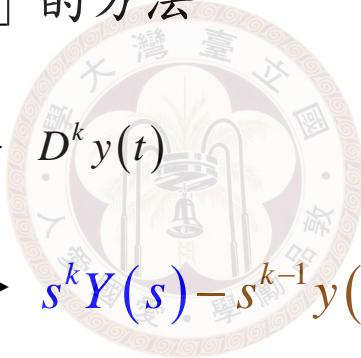

教學網頁：<http://djj.ee.ntu.edu.tw/DE.htm>

【本著作除另有註明外，採取[創用cc「姓名標示－非商業性－相同方式分享」台灣3.0版](#)授權釋出】

# Chapter 8 Systems of Linear First-Order Differential Equations

另一種解「聯立微分方程式」的方法

(1) Section 4.8:  $\frac{d^k}{dt^k} y(t) \longrightarrow D^k y(t)$

(2) Chapter 7:  $\frac{d^k}{dt^k} y(t) \longrightarrow s^k Y(s) - s^{k-1} y(0) - s^{k-2} y'(0) - \dots - y^{(k-1)}(0)$

(3) Chapter 8: Using matrix operations

註：本章這學期只教不考

## 比較

(1) 這 3 種方法都只適用於 linear & constant coefficients 的情形

註：其實 Laplace transform 可用來解 nonlinear & non-constant coefficient DEs, 但過程頗為複雜

(2) Laplace transform 的方法優於 Section 4-8 的方法的地方，在於可以輕易的解決 initial condition 的問題

注意：但是，若 boundary conditions 不是在  $t = 0$  的地方，用 Laplace transform 需要花一番功夫。

(3) 無論是 Section 4-8 的方法，還是 Laplace transform，  
運算量皆不少

Chapter 8 的方法可以減少 1<sup>st</sup> order 聯立微分方程式的運算量

但 2<sup>nd</sup> order 以上反而比 Laplace transform 麻煩

# Section 8.1 Preliminary Theory

方法的限制：

- (a) linear,
- (b) 1<sup>st</sup> order DEs
- (c) full rank ( $n$  個 dependent variable 需要  $n$  個式子)

名詞：

- |                               |  |
|-------------------------------|--|
| linear system (pp. 514)       | homogeneous, nonhomogeneous (pp. 515)  |
| solution vector (pp. 515)     | fundamental set of solutions (pp. 519) |
| general solution (pp. 519)    | complementary function (pp. 523)       |
| particular solution (pp. 523) |  |

本節學習秘訣：和 Section 4-1 相比較

## 8-1-1 表示法和名詞

假設有  $n$  個 dependent variables  $x_1(t), x_2(t), \dots, x_n(t)$ ,

$n$  個只有針對其中一個dependent variable 作微分的 linear DEs

$$\frac{d}{dt}x_1(t) = a_{11}(t)x_1(t) + a_{12}(t)x_2(t) + \dots + a_{1n}(t)x_n(t) + f_1(t)$$

$$\frac{d}{dt}x_2(t) = a_{21}(t)x_1(t) + a_{22}(t)x_2(t) + \dots + a_{2n}(t)x_n(t) + f_2(t)$$

:

:

:

:

$$\frac{d}{dt}x_n(t) = a_{n1}(t)x_1(t) + a_{n2}(t)x_2(t) + \dots + a_{nn}(t)x_n(t) + f_n(t)$$

稱作 linear system

# Matrix form of a linear system

$$\boxed{\mathbf{X}' = \mathbf{AX} + \mathbf{F}}$$

$$\mathbf{X} = \begin{bmatrix} x_1(t) \\ x_2(t) \\ \vdots \\ x_n(t) \end{bmatrix}$$

$$\mathbf{A} = \begin{bmatrix} a_{11}(t) & a_{12}(t) & \cdots & \cdots & a_{1n}(t) \\ a_{21}(t) & a_{22}(t) & \ddots & \cdots & a_{2n}(t) \\ \vdots & \vdots & \ddots & \ddots & \vdots \\ \vdots & \vdots & \ddots & \ddots & \vdots \\ a_{n1}(t) & a_{n2}(t) & \cdots & \cdots & a_{nn}(t) \end{bmatrix}$$

$$\mathbf{F} = \begin{bmatrix} f_1(t) \\ f_2(t) \\ \vdots \\ f_n(t) \end{bmatrix}$$

solution vector

$f_n(t) = 0$  for all  $n$   $\rightarrow$  homogeneous linear system  
otherwise  $\rightarrow$  nonhomogeneous linear system

$$\begin{aligned} \frac{dx}{dt} &= x + 3y \\ \frac{dy}{dt} &= 5x + 3y \end{aligned} \quad \xrightarrow{\text{可改寫成}} \quad \mathbf{X}' = \begin{bmatrix} 1 & 3 \\ 5 & 3 \end{bmatrix} \mathbf{X} \quad \text{其中} \quad \mathbf{X} = \begin{bmatrix} x \\ y \end{bmatrix}$$

## Example 2 (text page 306)

$$\mathbf{X}_1 = \begin{bmatrix} e^{-2t} \\ -e^{-2t} \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \end{bmatrix} e^{-2t} \quad \mathbf{X}_2 = \begin{bmatrix} 3e^{6t} \\ 5e^{6t} \end{bmatrix} = \begin{bmatrix} 3 \\ 5 \end{bmatrix} e^{6t}$$

皆為  $\mathbf{X}' = \begin{bmatrix} 1 & 3 \\ 5 & 3 \end{bmatrix} \mathbf{X}$  的解

$$\mathbf{X}'_1 = \begin{bmatrix} -2e^{-2t} \\ 2e^{-2t} \end{bmatrix} \quad \mathbf{A}\mathbf{X}_1 = \begin{bmatrix} 1 & 3 \\ 5 & 3 \end{bmatrix} \begin{bmatrix} e^{-2t} \\ -e^{-2t} \end{bmatrix} = \begin{bmatrix} -2e^{-2t} \\ 2e^{-2t} \end{bmatrix} = \mathbf{X}'_1$$

$$\mathbf{X}'_2 = \begin{bmatrix} 18e^{6t} \\ 30e^{6t} \end{bmatrix} \quad \mathbf{A}\mathbf{X}_2 = \begin{bmatrix} 1 & 3 \\ 5 & 3 \end{bmatrix} \begin{bmatrix} 3e^{6t} \\ 5e^{6t} \end{bmatrix} = \begin{bmatrix} 18e^{6t} \\ 30e^{6t} \end{bmatrix} = \mathbf{X}'_2$$

If  $x_1(t_0) = r_1, x_2(t_0) = r_2, \dots, x_n(t_0) = r_n$ ,

linear system 可寫成

$$\mathbf{X}' = \mathbf{AX} + \mathbf{F} \quad \text{subject to} \quad \mathbf{X}(t_0) = \mathbf{X}_0$$

$$\mathbf{X}(t_0) = \begin{bmatrix} x_1(t_0) \\ x_2(t_0) \\ \vdots \\ \vdots \\ x_n(t_0) \end{bmatrix} \quad \mathbf{X}_0 = \begin{bmatrix} r_1 \\ r_2 \\ \vdots \\ \vdots \\ r_n \end{bmatrix}$$

## 8-1-2 基本定理

將 Section 4-1 的幾個定理改成 vector 和 matrix 的型態

**[Theorem 8.1.1]** If the entries of  $\mathbf{A}$  and  $\mathbf{F}$  are **continuous** on a common interval that contains the point  $t_0$ , then the initial value problem on the previous page has a **unique solution** on this interval.

(比較 Theorem 4.1.1, page 137)

[**Theorem 8.1.2**] For the homogeneous linear system       $\mathbf{X}' = \mathbf{AX}$       ( $\mathbf{F} = \mathbf{0}$ )

if  $\mathbf{X}_1, \mathbf{X}_2, \dots, \mathbf{X}_n$  are the solution of     $\mathbf{X}' = \mathbf{AX}$

then     $\mathbf{X} = c_1\mathbf{X}_1 + c_2\mathbf{X}_2 + \dots + c_n\mathbf{X}_n$     is also a solution of     $\mathbf{X}' = \mathbf{AX}$

[**Definition 8.1.3 and Theorem 8.1.5**] If the size of  $\mathbf{A}$  is  $n \times n$  and  $\mathbf{X}_1, \mathbf{X}_2, \dots, \mathbf{X}_n$  are the **linearly independent solutions** of     $\mathbf{X}' = \mathbf{AX}$  , then  $\mathbf{X}_1, \mathbf{X}_2, \dots, \mathbf{X}_n$  are said to be a fundamental set of solutions.

Then, the general solution of     $\mathbf{X}' = \mathbf{AX}$     is

$$\boxed{\mathbf{X} = c_1\mathbf{X}_1 + c_2\mathbf{X}_2 + \dots + c_n\mathbf{X}_n}$$

$c_1, c_2, \dots, c_n$  are arbitrary constants

(比較 Theorem 4.1.5, page 144)

## [Theorem 8.1.3] Linearly dependent / independent 判斷方式

$$W(\mathbf{X}_1, \mathbf{X}_2, \dots, \mathbf{X}_n) = \det \begin{bmatrix} x_{11}(t) & x_{12}(t) & \cdots & \cdots & x_{1n}(t) \\ x_{21}(t) & x_{22}(t) & \cdots & \cdots & x_{2n}(t) \\ \vdots & \vdots & \ddots & & \vdots \\ \vdots & \vdots & \ddots & \ddots & \vdots \\ x_{n1}(t) & x_{n2}(t) & \cdots & \cdots & x_{nn}(t) \end{bmatrix}$$

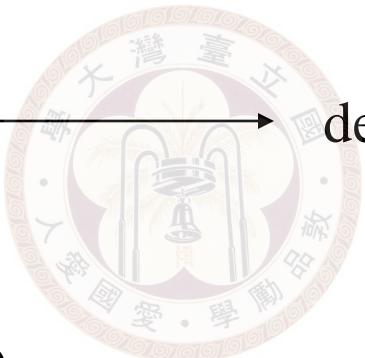

(課本用 || 來表示  $\det$ )

$$\mathbf{X}_1 = \begin{bmatrix} x_{11}(t) \\ x_{21}(t) \\ \vdots \\ x_{n1}(t) \end{bmatrix} \quad \mathbf{X}_2 = \begin{bmatrix} x_{12}(t) \\ x_{22}(t) \\ \vdots \\ x_{n2}(t) \end{bmatrix} \quad \dots \quad \mathbf{X}_n = \begin{bmatrix} x_{1n}(t) \\ x_{2n}(t) \\ \vdots \\ x_{nn}(t) \end{bmatrix}$$

Either  $W(\mathbf{X}_1, \mathbf{X}_2, \dots, \mathbf{X}_n) \neq 0$  for every  $t$   $\longrightarrow$  linearly independent

or  $W(\mathbf{X}_1, \mathbf{X}_2, \dots, \mathbf{X}_n) = 0$   $\longrightarrow$  dependent

(比較 Wronskian, page 147)

## Example 4 (text page 308)

$$\mathbf{X}_1 = \begin{bmatrix} e^{-2t} \\ -e^{-2t} \end{bmatrix} \quad \mathbf{X}_2 = \begin{bmatrix} 3e^{6t} \\ 5e^{6t} \end{bmatrix}$$

$$W(\mathbf{X}_1, \mathbf{X}_2) = \begin{vmatrix} e^{-2t} & 3e^{6t} \\ -e^{-2t} & 5e^{6t} \end{vmatrix} = \begin{vmatrix} 1 & 3 \\ -1 & 5 \end{vmatrix} e^{-2t+6t} = 8e^{4t} \neq 0$$

determinant

[Theorem 8.1.6] General solution for nonhomogeneous system

$$\mathbf{X}' = \mathbf{A}\mathbf{X} + \mathbf{F} \quad \text{subject to} \quad \mathbf{X}(t_0) = \mathbf{X}_0$$

$$\mathbf{X} = \mathbf{X}_c + \mathbf{X}_p$$

$$= c_1 \mathbf{X}_1 + c_2 \mathbf{X}_2 + \dots + c_n \mathbf{X}_n + \mathbf{X}_p$$

$\mathbf{X}_c = c_1 \mathbf{X}_1 + c_2 \mathbf{X}_2 + \dots + c_n \mathbf{X}_n$  稱作為 complementary function

$\mathbf{X}_p$  particular solution

(比較講義 page 149)

## 8-1-3 本節要注意的地方

- (1) 大部分的定理和 Section 4-1 相似
- (2) 當一個式子出現 2 個 dependent variable 的微分時  
先化成講義 page 514 linear system 的型態

# Section 8.2 Homogeneous Linear Systems

$$\mathbf{X}' = \mathbf{AX}$$

## 8-2-1 本節摘要

(A) 解法的限制：

同講義 page 513，但多了二個限制

(d) homogeneous

(e) 最好是 constant coefficients

$$\mathbf{A} = \begin{bmatrix} a_{11} & a_{12} & \cdots & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & & \vdots \\ \vdots & \vdots & & \ddots & \vdots \\ a_{n1} & a_{n2} & \cdots & \cdots & a_{nn} \end{bmatrix}$$

## (B) 解法

$$\mathbf{X}' = \mathbf{AX} \quad \text{size of } \mathbf{A}: n \times n \quad (\text{constant coefficients})$$

假設解為  $\mathbf{X}_a = \begin{bmatrix} k_{1,a} \\ k_{2,a} \\ \vdots \\ k_{n,a} \end{bmatrix} e^{\lambda_a t} = \mathbf{K}_a e^{\lambda_a t}$   $a = 1, 2, \dots, n$

其中

$\lambda_a$ :  $\mathbf{A}$  的 eigenvalue

$\mathbf{K}_a$ :  $\mathbf{A}$  的 eigenvector ( $\mathbf{AK}_a = \lambda \mathbf{K}_a$ )

General solution:

證明見講義 page 530

$$\mathbf{X} = c_1 \mathbf{K}_1 e^{\lambda_1 t} + c_2 \mathbf{K}_2 e^{\lambda_2 t} + c_3 \mathbf{K}_3 e^{\lambda_3 t} + \dots + c_n \mathbf{K}_n e^{\lambda_n t}$$

## (C) 三種情形

Case 1: **A has distinct eigenvalues**: 解法如前一頁

Case 2: **A has repeated eigenvalues**

當  $\lambda_a$  的 multiplicities 為  $m$

Case 2.1 可以找到  $\lambda_a$  的  $m$  個 linearly independent eigenvectors

解法同前一頁

Case 2.2 無法找到  $\lambda_a$  的  $m$  個 linearly independent eigenvectors

若只有 1 個 linearly independent eigenvector，將解表示成

$$\mathbf{X}_{a,1} = \mathbf{K}_{a,1} e^{\lambda_a t}$$

$$\mathbf{X}_{a,2} = \mathbf{K}_{a,1} \textcolor{red}{t} e^{\lambda_a t} + \mathbf{K}_{a,2} e^{\lambda_a t}$$

⋮

$$\mathbf{X}_{a,m} = \mathbf{K}_{a,1} \frac{t^{m-1}}{(m-1)!} e^{\lambda_a t} + \mathbf{K}_{a,2} \frac{t^{m-2}}{(m-2)!} e^{\lambda_a t} + \dots + \mathbf{K}_{a,m} e^{\lambda_a t}$$

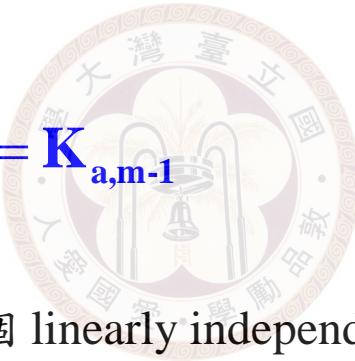

注意： $(\mathbf{A} - \lambda_a \mathbf{I}) \mathbf{K}_{a,1} = 0$

$$(\mathbf{A} - \lambda_a \mathbf{I}) \mathbf{K}_{a,2} = \mathbf{K}_{a,1}$$

$$(\mathbf{A} - \lambda_a \mathbf{I}) \mathbf{K}_{a,3} = \mathbf{K}_{a,2}$$

:

$$(\mathbf{A} - \lambda_a \mathbf{I}) \mathbf{K}_{a,m} = \mathbf{K}_{a,m-1}$$

Case 2.3 無法找到  $\lambda_a$  的  $m$  個 linearly independent eigenvectors

有超過 1 個 linearly independent eigenvector

其實，也可以用類似方法求解，但較為複雜

Case 3 若  $\lambda_a = \alpha + j\beta$  為  $\mathbf{A}$  的eigenvalues,  $\mathbf{A}$  為 real matrix

$\lambda_b = \alpha - j\beta$  必為  $\mathbf{A}$  的eigenvalues

若  $\mathbf{K}_a = \mathbf{B}_1 + j\mathbf{B}_2$  為  $\lambda_a$  所對應的 eigenvector

$\mathbf{K}_b = \mathbf{B}_1 - j\mathbf{B}_2$  必為  $\lambda_b$  所對應的 eigenvector

此時，可將解改寫成

$$\mathbf{X}_a = [\mathbf{B}_1 \cos \beta t - \mathbf{B}_2 \sin \beta t] e^{\alpha t}$$

$$\mathbf{X}_b = [\mathbf{B}_2 \cos \beta t + \mathbf{B}_1 \sin \beta t] e^{\alpha t}$$

## (D) 名詞與其他

multiplicity (pp. 539)

## 8-2-2 方法

$$\mathbf{X}' = \mathbf{AX}$$

假設解為  $\mathbf{X} = \begin{bmatrix} k_1 e^{\lambda t} \\ k_2 e^{\lambda t} \\ \vdots \\ \vdots \\ k_n e^{\lambda t} \end{bmatrix} = \begin{bmatrix} k_1 \\ k_2 \\ \vdots \\ \vdots \\ k_n \end{bmatrix} e^{\lambda t} = \mathbf{K} e^{\lambda t}$

$\mathbf{K} = \begin{bmatrix} k_1 \\ k_2 \\ \vdots \\ \vdots \\ k_n \end{bmatrix}$

(和 Section 4-3 相似)

$$\mathbf{X}' = \begin{bmatrix} k_1 \lambda e^{\lambda t} \\ k_2 \lambda e^{\lambda t} \\ \vdots \\ \vdots \\ k_n \lambda e^{\lambda t} \end{bmatrix} = \mathbf{K} \lambda e^{\lambda t}$$

$$\begin{aligned} \mathbf{X}' &= \mathbf{AX} \\ &\downarrow \quad \downarrow \\ \mathbf{K} \lambda e^{\lambda t} &= \mathbf{A} \mathbf{K} e^{\lambda t} \\ \lambda \mathbf{K} &= \mathbf{A} \mathbf{K} \end{aligned}$$

$\mathbf{X}' = \mathbf{AX}$  的問題變成  $\lambda\mathbf{K} = \mathbf{AK}$

(和 linear algebra 當中解 eigenvector, eigenvalue 的問題相同)

$$\lambda \mathbf{K} = \mathbf{A}\mathbf{K}$$

$$(\mathbf{A} - \lambda \mathbf{I})\mathbf{K} = 0$$

$$\mathbf{I} = \begin{bmatrix} 1 & 0 & 0 & \cdots & 0 \\ 0 & 1 & 0 & \cdots & 0 \\ 0 & 0 & 1 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & 1 \end{bmatrix}$$

$\lambda$  是  $\mathbf{A}$  的 eigenvalue

由  $\det(\mathbf{A} - \lambda \mathbf{I}) = 0$  算出

(稱作 characteristic equation)

$\mathbf{K}$  是  $\mathbf{A}$  的 eigenvector

當  $\lambda$  算出後， $\mathbf{K}$  為使得

$(\mathbf{A} - \lambda \mathbf{I})\mathbf{K} = 0$  成立  
的任一個滿足  $\mathbf{K} \neq 0$  的解

## Example 1 (text page 313)

$$\begin{aligned}\frac{dx}{dt} &= 2x + 3y \\ \frac{dy}{dt} &= 2x + y\end{aligned} \quad \longrightarrow \quad \mathbf{X}' = \mathbf{AX} \quad \mathbf{X} = \begin{bmatrix} x \\ y \end{bmatrix} \quad \mathbf{A} = \begin{bmatrix} 2 & 3 \\ 2 & 1 \end{bmatrix}$$

$$\det(\mathbf{A} - \lambda \mathbf{I}) = \begin{vmatrix} 2 - \lambda & 3 \\ 2 & 1 - \lambda \end{vmatrix} = \lambda^2 - 3\lambda - 4 = (\lambda + 1)(\lambda - 4) = 0$$

$\lambda = -1, 4$

(i) When  $\lambda = -1$

$$(\mathbf{A} - \lambda \mathbf{I})\mathbf{K} = \begin{bmatrix} 3 & 3 \\ 2 & 2 \end{bmatrix} \begin{bmatrix} k_1 \\ k_2 \end{bmatrix} = 0$$

$$\begin{cases} 3k_1 + 3k_2 = 0 \\ 2k_1 + 2k_2 = 0 \end{cases} \quad k_2 = -k_1$$

設  $k_1 = 1, \rightarrow k_2 = -1$        $\mathbf{K}_1 = \begin{bmatrix} 1 \\ -1 \end{bmatrix}$

(ii) When  $\lambda = 4$

$$(\mathbf{A} - \lambda \mathbf{I})\mathbf{K} = \begin{bmatrix} -2 & 3 \\ 2 & -3 \end{bmatrix} \begin{bmatrix} k_1 \\ k_2 \end{bmatrix} = 0 \quad \begin{cases} -2k_1 + 3k_2 = 0 \\ 2k_1 - 3k_2 = 0 \end{cases}$$

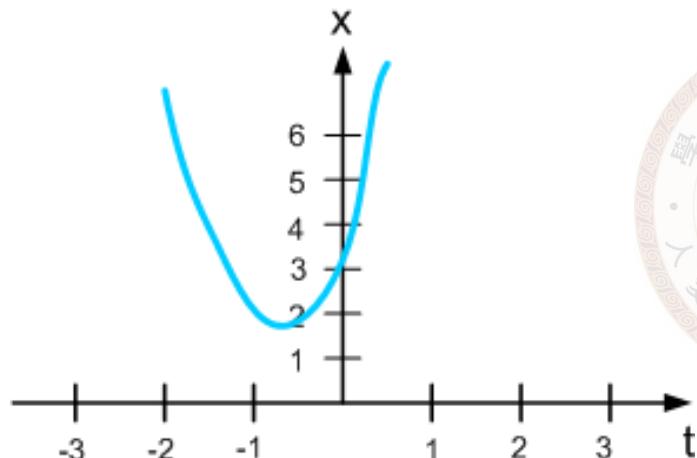

$$k_2 = 2k_1/3 \quad \text{設 } k_1 = 3, \quad k_2 = 2 \quad \mathbf{K}_2 = \begin{bmatrix} 3 \\ 2 \end{bmatrix}$$

$$\mathbf{X}_1 = \mathbf{K}_1 e^{-t} = \begin{bmatrix} 1 \\ -1 \end{bmatrix} e^{-t} \quad \mathbf{X}_2 = \mathbf{K}_2 e^{4t} = \begin{bmatrix} 3 \\ 2 \end{bmatrix} e^{4t}$$

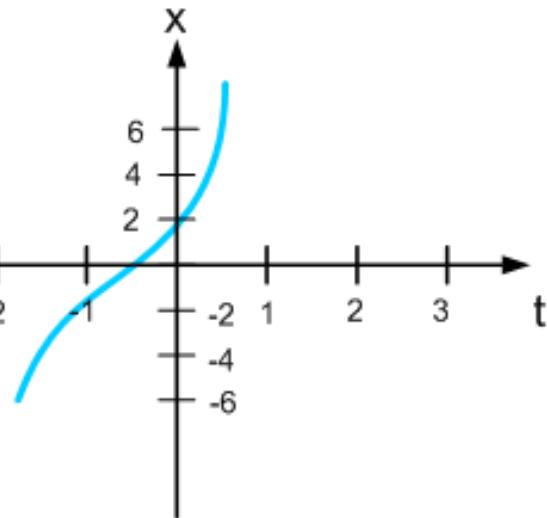

$$\mathbf{X} = c_1 \mathbf{X}_1 + c_2 \mathbf{X}_2 = c_1 \begin{bmatrix} 1 \\ -1 \end{bmatrix} e^{-t} + c_2 \begin{bmatrix} 3 \\ 2 \end{bmatrix} e^{4t}$$

$$\begin{bmatrix} x \\ y \end{bmatrix} = c_1 \begin{bmatrix} 1 \\ -1 \end{bmatrix} e^{-t} + c_2 \begin{bmatrix} 3 \\ 2 \end{bmatrix} e^{4t}$$

trajectory

(a) Graph of  $x = e^{-t} + 3e^{4t}$

(b) Graph of  $x = -e^{-t} + 2e^{4t}$

Fig. 8.2.1

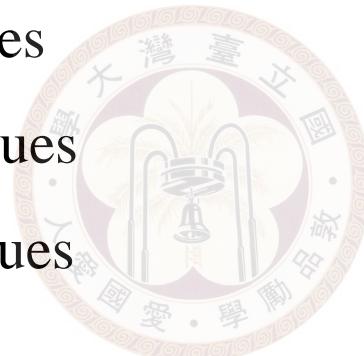

## 8-2-3 Case 1: Distinct Eigenvalues

根據 eigenvalues , 分成 3 cases

Case 1: Distinct eigenvalues

Case 2: Repeated eigenvalues

Case 3: Complex eigenvalues

## Example 2 (text page 314)

$$\frac{dx}{dt} = -4x + y + z$$

$$\frac{dy}{dt} = x + 5y - z$$

$$\frac{dz}{dt} = -y - 3z$$

$$\mathbf{A} = \begin{bmatrix} -4 & 1 & 1 \\ 1 & 5 & -1 \\ 0 & 1 & -3 \end{bmatrix}$$

$$\det(\mathbf{A} - \lambda\mathbf{I}) = -(\lambda + 3)(\lambda + 4)(\lambda - 5) = 0$$

$$\lambda = -3, -4, 5 \text{ (distinct)}$$

When  $\lambda = -3$

$$(\mathbf{A} - \lambda \mathbf{I}) \mathbf{K}_1 = \begin{bmatrix} -1 & 1 & 1 \\ 1 & 8 & -1 \\ 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} k_1 \\ k_2 \\ k_3 \end{bmatrix}$$

3<sup>rd</sup> row:  $k_2 = 0$

1<sup>st</sup> row:  $-k_1 + k_2 + k_3 = -k_1 + k_3 = 0, k_1 = k_3$

$$\mathbf{K}_1 = \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}$$

When  $\lambda = -4, \lambda = 5$  (自己練習解解看)

$$X = c_1 \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} e^{-3t} + c_2 \begin{bmatrix} 10 \\ -1 \\ 1 \end{bmatrix} e^{-4t} + c_3 \begin{bmatrix} 1 \\ 8 \\ 1 \end{bmatrix} e^{5t}$$

## 8-2-4 Case 2: Repeated Eigenvalues

有時,  $\det(\mathbf{A} - \lambda\mathbf{I})$  會出現  $(\lambda - \lambda_a)^m$

$\lambda_a$  被稱作 eigenvalue of multiplicity m

$$\mathbf{A} = \begin{bmatrix} 3 & -18 \\ 2 & -9 \end{bmatrix}$$

$$\det(\mathbf{A} - \lambda\mathbf{I}) = (\lambda + 3)^2$$

$$\mathbf{A} = \begin{bmatrix} 1 & -2 & 2 \\ -2 & 1 & -2 \\ 2 & -2 & 1 \end{bmatrix}$$

$$\det(\mathbf{A} - \lambda\mathbf{I}) = -(\lambda + 1)^2(\lambda - 5)$$

(這種情形較複雜，但也是本節的重點)

## Case 2.1

當  $\lambda_a$  的 multiplicity 為  $m$  ( $m > 1$ ) 時，有的時候可以將  $m$  個 linearly independent eigenvectors 全部找出來。

此時，solutions 解法和 Case 1 相同

注意：

當  $\mathbf{A} = \mathbf{A}^T$  時，若  $\lambda_a$  的 multiplicity 為  $m$ ，一定可以找到  $\lambda_a$  所對應的  $m$  個 linearly independent eigenvectors

**Example 3** (text page 316)

$$\mathbf{X}' = \mathbf{AX}$$

$$\mathbf{A} = \begin{bmatrix} 1 & -2 & 2 \\ -2 & 1 & -2 \\ 2 & -2 & 1 \end{bmatrix}$$

$$\det(\mathbf{A} - \lambda \mathbf{I}) = -(\lambda + 1)^2 (\lambda - 5)$$

(i) 當  $\lambda = -1$

$$(\mathbf{A} - \lambda \mathbf{I}) \begin{bmatrix} k_1 \\ k_2 \\ k_3 \end{bmatrix} = \begin{bmatrix} 2 & -2 & 2 \\ -2 & 2 & -2 \\ 2 & -2 & 2 \end{bmatrix} \begin{bmatrix} k_1 \\ k_2 \\ k_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

row operation    new 2<sup>nd</sup> row = old 2<sup>nd</sup> row + 1<sup>st</sup> row

new 3<sup>rd</sup> row = old 3<sup>rd</sup> row - 1<sup>st</sup> row

$$\begin{bmatrix} 2 & -2 & 2 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} k_1 \\ k_2 \\ k_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$2(k_1 - k_2 + k_3) = 0$$

3 個 variables, 1 個式子

$$3 - 1 = 2$$

2 個 linearly independent solutions

$$2(k_1 - k_2 + k_3) = 0$$

2 個 linearly independent solutions

(第一個 solution) 設  $k_1 = 0, k_2 = 1 \rightarrow k_3 = 1$

(第二個 solution) 設  $k_1 = 1, k_2 = 0 \rightarrow k_3 = -1$

Check:  $\begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix}$  的確互為 linearly independent  
為  $\mathbf{A}$  在  $\lambda = -1$  時的 eigenvectors

小技巧：任意給定其他  $n-1$  個 unknowns 的值

再將最後一個 unknown 的值算出來

通常可以得到一個新的 independent solution

(但是也有的時候得到的解不為 independent, 所以要 check)

(ii) 當  $\lambda = 5$

算出來的 eigenvector 為

$$\begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

General solution for Example 3:

$$\mathbf{X} = c_1 \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} e^t + c_2 \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix} e^t + c_3 \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} e^{-5t}$$

**Case 2.2** 當  $\lambda_a$  的 multiplicity 為  $m$  ( $m > 1$ ) 時，有的時候只能找出 1 個 linearly independent eigenvector  $\mathbf{K}_{a,1}$ 。

將  $\lambda_a$  所對應的  $m$  個解表示成

$$\mathbf{X}_{a,1} = \mathbf{K}_{a,1} e^{\lambda_a t}$$

$$\mathbf{X}_{a,2} = \mathbf{K}_{a,1} \mathbf{t} e^{\lambda_a t} + \mathbf{K}_{a,2} e^{\lambda_a t}$$

$$\mathbf{X}_{a,3} = \mathbf{K}_{a,1} \frac{t^2}{2} e^{\lambda_a t} + \mathbf{K}_{a,2} \mathbf{t} e^{\lambda_a t} + \mathbf{K}_{a,3} e^{\lambda_a t}$$

:

$$\mathbf{X}_{a,m} = \mathbf{K}_{a,1} \frac{t^{m-1}}{(m-1)!} e^{\lambda_a t} + \mathbf{K}_{a,2} \frac{t^{m-2}}{(m-2)!} e^{\lambda_a t} + \dots + \mathbf{K}_{a,m} e^{\lambda_a t}$$

$\mathbf{K}_{a,1}$ : 唯一滿足  $\mathbf{A}\mathbf{K}_{a,1} = \lambda_a \mathbf{K}_{a,1}$  的 eigenvector

$\mathbf{K}_{a,q}$  ( $q \neq 1$ ) 的求法如後頁

$$\text{當 } \mathbf{X}_{\mathbf{a},\mathbf{p}} = \mathbf{K}_{\mathbf{a},1} \frac{t^{p-1}}{(p-1)!} e^{\lambda_a t} + \mathbf{K}_{\mathbf{a},2} \frac{t^{p-2}}{(p-2)!} e^{\lambda_a t} + \dots + \mathbf{K}_{\mathbf{a},p-1} \frac{t^1}{1!} e^{\lambda_a t} + \mathbf{K}_{\mathbf{a},p} e^{\lambda_a t} \quad (p = 1, 2, \dots, m)$$

$$\begin{aligned} \mathbf{X}'_{\mathbf{a},\mathbf{p}} &= \lambda_a \mathbf{K}_{\mathbf{a},1} \frac{t^{p-1}}{(p-1)!} e^{\lambda_a t} + (\mathbf{K}_{\mathbf{a},1} + \lambda_a \mathbf{K}_{\mathbf{a},2}) \frac{t^{p-2}}{(p-2)!} e^{\lambda_a t} + (\mathbf{K}_{\mathbf{a},2} + \lambda_a \mathbf{K}_{\mathbf{a},3}) \frac{t^{p-3}}{(p-3)!} e^{\lambda_a t} \\ &\quad + \dots + (\mathbf{K}_{\mathbf{a},p-2} + \lambda_a \mathbf{K}_{\mathbf{a},p-1}) \frac{t^1}{1!} e^{\lambda_a t} + (\mathbf{K}_{\mathbf{a},p-1} + \lambda_a \mathbf{K}_{\mathbf{a},p}) e^{\lambda_a t} \end{aligned}$$

$$\text{由 } \mathbf{X}' = \mathbf{AX} \quad \mathbf{AX} - \mathbf{X}' = 0$$

$$\text{比較 } \mathbf{AX} - \mathbf{X}' = 0 \quad \text{當中}$$

$$\frac{t^q}{q!} e^{\lambda_a t} \quad (q = 0, 1, \dots, m-1) \text{ 的係數得出}$$

$$\left\{ \begin{array}{l} (\mathbf{A} - \lambda_a \mathbf{I}) \mathbf{K}_{\mathbf{a},1} = 0 \\ (\mathbf{A} - \lambda_a \mathbf{I}) \mathbf{K}_{\mathbf{a},2} = \mathbf{K}_{\mathbf{a},1} \\ (\mathbf{A} - \lambda_a \mathbf{I}) \mathbf{K}_{\mathbf{a},3} = \mathbf{K}_{\mathbf{a},2} \\ \vdots \\ (\mathbf{A} - \lambda_a \mathbf{I}) \mathbf{K}_{\mathbf{a},p} = \mathbf{K}_{\mathbf{a},p-1} \end{array} \right.$$

由  $\mathbf{K}_{\mathbf{a},1}$  求出  $\mathbf{K}_{\mathbf{a},2}$

由  $\mathbf{K}_{\mathbf{a},2}$  求出  $\mathbf{K}_{\mathbf{a},3}$

:

由  $\mathbf{K}_{\mathbf{a},p-1}$  求出  $\mathbf{K}_{\mathbf{a},p}$

註：(1) 課本 page 316 中

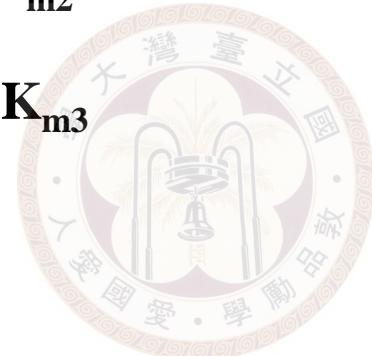

$$\mathbf{K}_{11} = \mathbf{K}_{21} = \dots = \mathbf{K}_{m1}$$

$$\mathbf{K}_{22} = \mathbf{K}_{32} = \dots = \mathbf{K}_{m2}$$

$$\mathbf{K}_{33} = \mathbf{K}_{43} = \dots = \mathbf{K}_{m3}$$

:

:

(2)  $(\mathbf{A} - \lambda_a \mathbf{I}) \mathbf{K}_{a,b+1} = \mathbf{K}_{a,b}$  經常有多個 linearly independent 解

在這種情形下，我們只需找出 其中一個解即個

(但是必需以可以繼續解下去為條件，如 page 548)

## Example 5 (text page 319)

$$\mathbf{X}' = \mathbf{AX} \quad \mathbf{A} = \begin{bmatrix} 2 & 1 & 6 \\ 0 & 2 & 5 \\ 0 & 0 & 2 \end{bmatrix}$$

$$\det(\mathbf{A} - \lambda\mathbf{I}) = (2 - \lambda)^3 \quad \text{eigenvalues: } 2, 2, 2$$

$$(\mathbf{A} - 2\mathbf{I}) \begin{bmatrix} k_1 \\ k_2 \\ k_3 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 6 \\ 0 & 0 & 5 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} k_1 \\ k_2 \\ k_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}.$$

$$5k_3 = 0, \quad k_2 + 6k_3 = 0 \quad \longrightarrow \quad k_2 = k_3 = 0$$

only one independent solution:

$$\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \quad \mathbf{K}_{\mathbf{a},1} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$$

$$(\mathbf{A} - 2\mathbf{I})\mathbf{K}_{a,2} = \mathbf{K}_{a,1},$$

$$\begin{bmatrix} 0 & 1 & 6 \\ 0 & 0 & 5 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} k_1 \\ k_2 \\ k_3 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$$

$$5k_3 = 0, \quad k_2 + 6k_3 = 1$$

選擇其中一個 solution:

$$\mathbf{K}_{a,2} = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$$

注意：若選擇  $\mathbf{K}_{a,2}$  為其他的值，最後的解還是一樣的

$$(\mathbf{A} - 2\mathbf{I})\mathbf{K}_{a,3} = \mathbf{K}_{a,2}, \quad \begin{bmatrix} 0 & 1 & 6 \\ 0 & 0 & 5 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} k_1 \\ k_2 \\ k_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$$

$$5k_3 = 1, \quad k_2 + 6k_3 = 0$$

其中一個 solution:

$$\mathbf{K}_{a,3} = \begin{bmatrix} 0 \\ -6/5 \\ 1/5 \end{bmatrix}$$

## General solution of Example 5

$$\mathbf{X} = c_1 \mathbf{K}_{a,1} e^{2t} + c_2 (\mathbf{K}_{a,1} t e^{2t} + \mathbf{K}_{a,2} e^{2t}) + c_3 (\mathbf{K}_{a,1} \frac{t^2}{2} e^{2t} + \mathbf{K}_{a,2} t e^{2t} + \mathbf{K}_{a,3} e^{2t})$$

$$\mathbf{X} = c_1 \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} e^{2t} + c_2 \left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} t e^{2t} + \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} e^{2t} \right\} + c_3 \left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \frac{t^2}{2} e^{2t} + \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} t e^{2t} + \begin{bmatrix} 0 \\ -6/5 \\ 1/5 \end{bmatrix} e^{2t} \right\}$$

**Case 2.3** 當  $\lambda_a$  的 multiplicity 為  $m$  ( $m > 1$ ) 時，有的時候只能找出  $2 \sim m - 1$  個 linearly independent eigenvectors。

例子：Section 8-2 Exercises 31 and 50

$$\mathbf{X}' = \mathbf{AX} \quad \mathbf{A} = \begin{bmatrix} 2 & 1 & 0 & 0 & 0 \\ 0 & 2 & 0 & 0 & 0 \\ 0 & 0 & 2 & 0 & 0 \\ 0 & 0 & 0 & 2 & 1 \\ 0 & 0 & 0 & 0 & 2 \end{bmatrix} \quad \det(\mathbf{A} - \lambda \mathbf{I}) = (2 - \lambda)^5$$

three independent solutions:

$$\begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 \\ 0 \\ 0 \\ 1 \\ 0 \end{bmatrix}$$

$$\text{Set } \mathbf{K}_{a,1} = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}, \quad (\mathbf{A} - 2\mathbf{I}) \begin{bmatrix} k_1 \\ k_2 \\ k_3 \\ k_4 \\ k_5 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} k_1 \\ k_2 \\ k_3 \\ k_4 \\ k_5 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

$$k_2 = 1, \quad k_4 = 0$$

Choose  $\mathbf{K}_{a,2} =$

$$\begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

但  $(\mathbf{A} - 2\mathbf{I})\mathbf{K}_{a,3} = \mathbf{K}_{a,2}$  無解

Set  $\mathbf{K}_{a,1} = \begin{bmatrix} 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{bmatrix}$ ,   $(\mathbf{A} - 2\mathbf{I})\mathbf{K}_{a,2} = \mathbf{K}_{a,1}$  無解

Set  $\mathbf{K}_{a,1} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 1 \\ 0 \end{bmatrix}$ ,   $(\mathbf{A} - 2\mathbf{I})\mathbf{K}_{a,2} = \mathbf{K}_{a,1}$  的解為

$$\mathbf{K}_{a,2} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 1 \end{bmatrix}$$

(當一個解無法繼續算時，嘗試由其他的解來算)

## General solution for Exercises 31 and 50

$$\mathbf{X} = c_1 \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix} e^{2t} + c_2 \begin{bmatrix} 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{bmatrix} e^{2t} + c_3 \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 1 \end{bmatrix} e^{2t}$$
$$+ c_4 \left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix} te^{2t} + \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 0 \end{bmatrix} e^{2t} \right\} + c_5 \left\{ \begin{bmatrix} 0 \\ 0 \\ 0 \\ 1 \\ 0 \end{bmatrix} te^{2t} + \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 1 \end{bmatrix} e^{2t} \right\}$$

## 8-2-5 Case 3: Complex Conjugated Eigenvalues

其實和 Case 1 (distinct eigenvalues) 相同

只是用不同的方式來表示 solutions

$$\mathbf{X}' = \mathbf{AX}$$

當  $\lambda_a = \alpha + j\beta$  和  $\lambda_b = \alpha - j\beta$  ( $\alpha, \beta$  為 real) 皆為  $\mathbf{A}$  的 eigenvector

且  $\mathbf{A}$  為 real matrix

若  $\mathbf{K}_a = \mathbf{B}_1 + j\mathbf{B}_2$  ( $\mathbf{B}_1, \mathbf{B}_2$  為 real) 是  $\lambda_a$  所對應的 eigenvector

則  $\mathbf{K}_b = \mathbf{B}_1 - j\mathbf{B}_2$  必為是  $\lambda_b$  所對應的 eigenvector

Proof:  $\mathbf{AK}_a = \lambda_a \mathbf{K}_a$        $\overline{\mathbf{AK}_a} = \overline{\lambda_a} \overline{\mathbf{K}_a}$        $\mathbf{A}\overline{\mathbf{K}_a} = \overline{\lambda_a} \overline{\mathbf{K}_a}$

$$\mathbf{AK}_b = \lambda_a \mathbf{K}_b$$

此時，可將解改寫成

$$\mathbf{X}_a = [\mathbf{B}_1 \cos \beta t - \mathbf{B}_2 \sin \beta t] e^{\alpha t}$$

$$\mathbf{X}_b = [\mathbf{B}_2 \cos \beta t + \mathbf{B}_1 \sin \beta t] e^{\alpha t}$$

(證明如後)

$$\begin{aligned}
& c_a(\mathbf{B}_1 + j\mathbf{B}_2)e^{(\alpha+j\beta)t} + c_b(\mathbf{B}_1 - j\mathbf{B}_2)e^{(\alpha-j\beta)t} \\
&= c_a e^{\alpha t} (\mathbf{B}_1 + j\mathbf{B}_2)(\cos \beta t + j \sin \beta t) + c_b e^{\alpha t} (\mathbf{B}_1 - j\mathbf{B}_2)(\cos \beta t - j \sin \beta t) \\
&= c_a e^{\alpha t} (\mathbf{B}_1 \cos \beta t - \mathbf{B}_2 \sin \beta t) + c_a e^{\alpha t} (j\mathbf{B}_1 \sin \beta t + j\mathbf{B}_2 \cos \beta t) \\
&\quad + c_b e^{\alpha t} (\mathbf{B}_1 \cos \beta t - \mathbf{B}_2 \sin \beta t) - c_b e^{\alpha t} (j\mathbf{B}_1 \sin \beta t + j\mathbf{B}_2 \cos \beta t) \\
&= (c_a + c_b) e^{\alpha t} (\mathbf{B}_1 \cos \beta t - \mathbf{B}_2 \sin \beta t) + j(c_a - c_b) e^{\alpha t} (\mathbf{B}_1 \sin \beta t + \mathbf{B}_2 \cos \beta t)
\end{aligned}$$

因此，兩個 linearly independent solutions 可改寫為

$$\mathbf{X}_a = [\mathbf{B}_1 \cos \beta t - \mathbf{B}_2 \sin \beta t] e^{\alpha t}$$

$$\mathbf{X}_b = [\mathbf{B}_2 \cos \beta t + \mathbf{B}_1 \sin \beta t] e^{\alpha t}$$

## Example 6 (text page 322)

$$\mathbf{X}' = \mathbf{AX} \quad \mathbf{A} = \begin{bmatrix} 2 & 8 \\ -1 & -2 \end{bmatrix}$$

已知  $\lambda = 2i$  為其中一個 eigenvalue，所對應的 eigenvector

為  $\begin{bmatrix} 2+2i \\ -1 \end{bmatrix}$

可以迅速判斷 2 個 independent solutions 為

$$\mathbf{X}_1 = \begin{bmatrix} 2 \\ -1 \end{bmatrix} \cos 2t - \begin{bmatrix} 2 \\ 0 \end{bmatrix} \sin 2t \quad \mathbf{X}_2 = \begin{bmatrix} 2 \\ 0 \end{bmatrix} \cos 2t + \begin{bmatrix} 2 \\ -1 \end{bmatrix} \sin 2t$$

## 8-2-6 高階線性聯立微分方程的解法

$$m_1 x_1'' = -k_1 x_1 + k_2 (x_2 - x_1)$$

$$m_2 x_2'' = -k_2 (x_2 - x_1)$$

解法：將問題變成 1<sup>st</sup> order DE

$$\begin{aligned}x_1' &= \color{red}{x_3} \\x_2' &= \color{red}{x_4} \\m_1 x_3' &= -k_1 x_1 + k_2 (x_2 - x_1) \\m_2 x_4' &= -k_2 (x_2 - x_1)\end{aligned}$$

$$\mathbf{X}' = \mathbf{AX}$$

$$\mathbf{X} = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix}$$

$$\mathbf{A} = \begin{bmatrix} 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -\frac{k_1}{m_1} - \frac{k_2}{m_1} & \frac{k_2}{m_1} & 0 & 0 \\ \frac{k_2}{m_2} & -\frac{k_2}{m_2} & 0 & 0 \end{bmatrix}$$

## 8-2-7 Section 8-2 要注意的地方

- (1) 方法適用的情形 (a) linear, (b) 1<sup>st</sup> order DEs, (c) full rank ( $n$  個 dependent variable 需要  $n$  個式子), (d) homogeneous, (e) constant coefficients
- (2) 複習並熟悉算 eigenvector 的方法  
(可以研究快速法)  
(我們只要得出任何一個 eigenvector 或任何一組 linearly independent eigenvectors 即可，因此可以選擇當中較簡單的)
- (3) Case 2 比較複雜，要多加練習
- (4) 注意 page 542 找 independent solution 的小技巧
- (5) Case 2.2  $(A - \lambda_a I) K_{a,b+1} = K_{a,b}$  選擇其中一組解即可 (但是要可以繼續解下去)

- (6) 計算前，確定  $\frac{d}{dt}x_k$  的係數皆為 1 (standard form)
- (7) 熟悉原理，才不會背錯公式

# Section 8.3 Nonhomogeneous Linear Systems

## 8.3.1 Section 8.3 摘要

本節討論如何找  $\mathbf{X}' = \mathbf{AX} + \mathbf{F}$  的 particular solution

(方法 1) undetermined coefficients

猜 particular solutions，類似 Section 4-4

(方法 2) variation of parameters，類似 Section 4-6

$$\mathbf{X}' = \Phi \mathbf{C}(\Phi) \Phi^{-1} \mathbf{F} \quad (t) \int \Phi^{-1}(t) \mathbf{F}(t) dt$$

$\Phi(t)$ : fundamental matrix，定義見 page 570

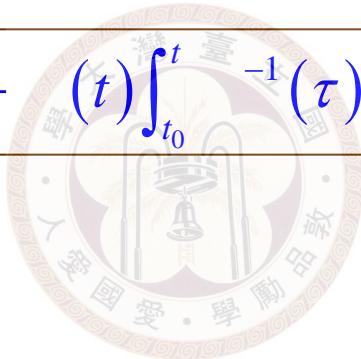

$$\mathbf{C} = \begin{bmatrix} c_1 \\ c_2 \\ \vdots \\ c_n \end{bmatrix}$$

(方法 2) variation of parameters , with initial conditions

$$\mathbf{X}' = \mathbf{AX} + \mathbf{F} \quad \mathbf{X}(t_0) = \mathbf{X}_0$$

$$\boxed{\mathbf{X}(t) = \mathbf{X}(t_0) + \int_{t_0}^t \mathbf{F}^{-1}(\tau) \mathbf{B}(\tau) d\tau}$$

名詞：fundamental matrix

## 8.3.2 方法一: Undetermined Coefficients

和 Section 4.4 的方法相似

$$\mathbf{X}' = \mathbf{A}\mathbf{X} + \mathbf{F}$$

根據  $F(t)$  來「猜」 particular solution

複習講義 page 191

(1) 出現  $t^n$  →

(2) 出現  $\cos(at)$  →

(3) 出現  $\exp(bt)$  →

- (4) 出現「綜合」
- (5) 只要  $F(t)$  其中有一個 entry 有某一项  
則 particular solution 其他每一個 entry 都要根據這一項來猜  
particular solution 的型態 (見 page 566的注意)  
(這一點和 Section 4.4 稍有所不同)
- (6) 和 homogeneous solution 有重覆時，不只乘  $t$ ，原來的 term 也保留  
(見 page 568)  
(這一點也和 Section 4.4 有所不同)

### Example 3 (text page 328)

$$\frac{dx}{dt} = 5x + 3y - 2e^{-t} + 1$$

$$\frac{dy}{dt} = -x + y + e^{-t} - 5t + 7$$

solving the complementary function

$$\mathbf{X}'_{\mathbf{C}} = \mathbf{A}\mathbf{X}_{\mathbf{C}} \quad \mathbf{A} = \begin{bmatrix} 5 & 3 \\ -1 & 1 \end{bmatrix}$$

eigenvalues of  $\mathbf{A}$ : 2, 4

corresponding eigenvectors for  $\lambda = 2$ :

$$\begin{bmatrix} 1 \\ -1 \end{bmatrix}$$

corresponding eigenvectors for  $\lambda = 4$ :

$$\begin{bmatrix} 3 \\ -1 \end{bmatrix}$$

complementary function

$$\mathbf{X}_{\mathbf{c}} = c_1 \begin{bmatrix} 1 \\ -1 \end{bmatrix} e^{2t} + c_2 \begin{bmatrix} 3 \\ -1 \end{bmatrix} e^{4t}$$

## 解 particular solution

因為  $\mathbf{F}(t) = \begin{bmatrix} -2e^{-t} + 1 \\ e^{-t} - 5t + 7 \end{bmatrix}$ ，所以假設 particular solution 為

$$\mathbf{X}_p(t) = \begin{bmatrix} a_1 \\ b_1 \end{bmatrix} + \begin{bmatrix} a_2 \\ b_2 \end{bmatrix}t + \begin{bmatrix} a_3 \\ b_3 \end{bmatrix}e^{-t} = \begin{bmatrix} a_1 + a_2t + a_3e^{-t} \\ b_1 + b_2t + b_3e^{-t} \end{bmatrix}$$

◆ 注意，每一個 entry 皆有  $1, t, e^{-t}$

From  $\mathbf{X}' = \mathbf{AX} + \mathbf{F}$

$$\begin{bmatrix} a_2 - a_3e^{-t} \\ b_2 - b_3e^{-t} \end{bmatrix} = \begin{bmatrix} 5a_1 + 3b_1 + (5a_2 + 3b_2)t + (5a_3 + 3b_3)e^{-t} \\ -a_1 + b_1 + (-a_2 + b_2)t + (-a_3 + b_3)e^{-t} \end{bmatrix} + \begin{bmatrix} -2e^{-t} + 1 \\ e^{-t} - 5t + 7 \end{bmatrix}$$

$$\begin{bmatrix} a_2 - a_3 e^{-t} \\ b_2 - b_3 e^{-t} \end{bmatrix} = \begin{bmatrix} 5a_1 + 3b_1 + (5a_2 + 3b_2)t + (5a_3 + 3b_3)e^{-t} \\ -a_1 + b_1 + (-a_2 + b_2)t + (-a_3 + b_3)e^{-t} \end{bmatrix} + \begin{bmatrix} -2e^{-t} + 1 \\ e^{-t} - 5t + 7 \end{bmatrix}$$

$$-5a_1 + a_2 - 3b_1 = 1$$

$$a_1 - b_1 + b_2 = 7$$

$$5a_2 + 3b_2 = 0$$

$$-a_2 + b_2 = 5$$

$$6a_3 + 3b_3 = 2$$

$$a_3 - 2b_3 = 1$$

$$a_1 = \frac{35}{32}, \quad b_1 = -\frac{89}{32}, \quad a_2 = -\frac{15}{8}, \quad b_2 = \frac{25}{8}, \quad a_3 = \frac{7}{15}, \quad b_3 = -\frac{4}{15}$$

$$\mathbf{X} = c_1 \begin{bmatrix} 1 \\ -1 \end{bmatrix} e^{2t} + c_2 \begin{bmatrix} 3 \\ -1 \end{bmatrix} e^{4t} + \begin{bmatrix} \frac{35}{32} \\ -\frac{89}{32} \end{bmatrix} + \begin{bmatrix} -\frac{15}{8} \\ \frac{25}{8} \end{bmatrix} t + \begin{bmatrix} \frac{7}{15} \\ -\frac{4}{15} \end{bmatrix} e^{-t}$$

## 補充的範例 (Example 1 in text page 327 的變型)

$$\mathbf{X}' = \mathbf{AX} + \mathbf{F} \quad \mathbf{A} = \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix} \quad \mathbf{F} = \begin{bmatrix} -8 \\ 3 \end{bmatrix}$$

$$\lambda = 0, 2 \quad \text{eigenvector : } \begin{bmatrix} 1 \\ -1 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

$$\mathbf{X}_c = c_1 \begin{bmatrix} 1 \\ -1 \end{bmatrix} + c_2 \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{2t}$$

設 particular solution 為

$$\mathbf{X}_p(t) = \begin{bmatrix} a_1 \\ b_1 \end{bmatrix} + \begin{bmatrix} a_2 \\ b_2 \end{bmatrix} t$$

◆ 注意，這一項要保留

$$\begin{bmatrix} a_2 \\ b_2 \end{bmatrix} = \begin{bmatrix} a_1 + b_1 \\ a_1 + b_1 \end{bmatrix} + t \begin{bmatrix} a_2 + b_2 \\ a_2 + b_2 \end{bmatrix} + \begin{bmatrix} -8 \\ 3 \end{bmatrix}$$

乘  $t$

$$\begin{bmatrix} a_2 \\ b_2 \end{bmatrix} = \begin{bmatrix} a_1 + b_1 \\ a_1 + b_1 \end{bmatrix} + t \begin{bmatrix} a_2 + b_2 \\ a_2 + b_2 \end{bmatrix} + \begin{bmatrix} -8 \\ 3 \end{bmatrix}$$

$$\begin{cases} a_2 = a_1 + b_1 - 8 \\ b_2 = a_1 + b_1 + 3 \\ a_2 + b_2 = 0 \end{cases} \xrightarrow{\hspace{2cm}} \begin{cases} a_2 - b_2 = -11 \\ a_2 + b_2 = 0 \end{cases} \xrightarrow{\hspace{2cm}} a_2 = -\frac{11}{2}, \quad b_2 = \frac{11}{2}$$

$$a_1 + b_1 = \frac{5}{2} \quad \text{choose } a_1 = 0, \quad b_1 = \frac{5}{2}$$

$$\mathbf{X} = c_1 \begin{bmatrix} 1 \\ -1 \end{bmatrix} + c_2 \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{2t} + \begin{bmatrix} 0 \\ \frac{5}{2} \end{bmatrix} + \begin{bmatrix} -\frac{11}{2} \\ \frac{11}{2} \end{bmatrix} t$$

### 8.3.3.1 方法二: Variation of Parameters

$$\mathbf{X}(t) = c_1 \begin{bmatrix} x_{11}(t) \\ x_{21}(t) \\ \vdots \\ x_{n1}(t) \end{bmatrix} + c_2 \begin{bmatrix} x_{12}(t) \\ x_{22}(t) \\ \vdots \\ x_{n2}(t) \end{bmatrix} + \dots + c_n \begin{bmatrix} x_{1n}(t) \\ x_{2n}(t) \\ \vdots \\ x_{nn}(t) \end{bmatrix}$$

fundamental matrix  $\Phi(t)$

$$\begin{bmatrix} x_{11}(t) & x_{12}(t) & \cdots & x_{1n}(t) \\ x_{21}(t) & x_{22}(t) & \cdots & x_{2n}(t) \\ \vdots & \vdots & \ddots & \vdots \\ x_{n1}(t) & x_{n2}(t) & \cdots & x_{nn}(t) \end{bmatrix}$$

令  $\mathbf{X}_p(\Phi)\mathbf{U} = \begin{pmatrix} \mathbf{U}(t) & \mathbf{U}'(t) \end{pmatrix}$        $\mathbf{U}(t) = \begin{bmatrix} u_1(t) \\ u_2(t) \\ \vdots \\ u_n(t) \end{bmatrix}$

$$\mathbf{X}' = \mathbf{AX} + \mathbf{F}$$

$$\mathbf{X}'_p(\Phi)\mathbf{U}'(\Phi)\mathbf{U}(t) = \begin{pmatrix} \mathbf{U}'(t) \\ \mathbf{U}''(t) \end{pmatrix} = \mathbf{A}\mathbf{U}(t) + \mathbf{F}(t)$$

$$\Phi(\mathbf{U}(t))\Phi(\mathbf{U}'(t))\Phi(\mathbf{U}(t))\mathbf{A}\mathbf{U}(t) + \mathbf{F}(t) = \mathbf{U}'(t) + \mathbf{U}''(t) + \mathbf{F}(t)$$

由於  $\Phi(t)$  每個 column 都是 associated homogeneous DE 的解

$$\Phi'\mathbf{A}\Phi = \begin{pmatrix} \mathbf{U}'(t) \\ \mathbf{U}''(t) \end{pmatrix}$$

$$\mathbf{A}\Phi(\mathbf{U}(t))\Phi(\mathbf{U}'(t))\Phi(\mathbf{U}(t))\mathbf{A}\mathbf{U}(t) + \mathbf{F}(t) = \mathbf{U}'(t) + \mathbf{U}''(t) + \mathbf{F}(t)$$

$$\Phi(\mathbf{U}(t))^{-1}\mathbf{F}(t) = \begin{pmatrix} \mathbf{U}(t) \\ \mathbf{U}'(t) \end{pmatrix}$$

$$\mathbf{U}(\Phi)^{-1} = \begin{pmatrix} \mathbf{U}(t) & \mathbf{U}'(t) \end{pmatrix}$$

$$\mathbf{U}(\Phi\mathbf{F}) = \begin{pmatrix} -1(t) & (t) \end{pmatrix}$$

$$\mathbf{U}(\Phi\mathbf{F}) = \int \begin{pmatrix} -1(t) & (t) \end{pmatrix} dt$$

$$\mathbf{X}_p(\Phi)\mathbf{U}(\Phi\Phi\mathbf{F}) \quad (t) = \begin{pmatrix} -1(t) \end{pmatrix} \int \begin{pmatrix} -1(t) & (t) \end{pmatrix} dt$$

$$\boxed{\mathbf{X}(\Phi\epsilon\Phi\Phi\mathbf{F}) + \begin{pmatrix} -1(t) \end{pmatrix} \int \begin{pmatrix} -1(t) & (t) \end{pmatrix} dt}$$

$$\mathbf{C} = \begin{bmatrix} c_1 \\ c_2 \\ \vdots \\ c_n \end{bmatrix} \quad \text{some constants}$$

## Example 4 (text page 331)

$$\mathbf{X}' = \mathbf{AX} + \mathbf{F} \quad \mathbf{A} = \begin{bmatrix} -3 & 1 \\ 2 & -4 \end{bmatrix} \quad \mathbf{F} = \begin{bmatrix} 3t \\ e^{-t} \end{bmatrix}$$

eigenvalues of  $\mathbf{A}$ :  $\lambda = -2, -5$

eigenvectors of  $\mathbf{A}$  :

$$\begin{bmatrix} 1 \\ 1 \end{bmatrix} \quad \begin{bmatrix} 1 \\ -2 \end{bmatrix}$$

$$\mathbf{X}_c(t) = c_1 \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{-2t} + c_2 \begin{bmatrix} 1 \\ -2 \end{bmatrix} e^{-5t}$$

fundamental matrix       $\Phi(t) = \begin{bmatrix} e^{-2t} & e^{-5t} \\ e^{-2t} & -2e^{-5t} \end{bmatrix}$

$$\Phi(t) = \begin{bmatrix} e^{-2t} & e^{-5t} \\ e^{-2t} & -2e^{-5t} \end{bmatrix} \quad \det(\Phi(t)) = -3e^{-7t}$$

$$\Phi^{-1}(t) = \frac{1}{\det(\Phi(t))} \begin{bmatrix} -2e^{-5t} & -e^{-5t} \\ -e^{-2t} & e^{-2t} \end{bmatrix} = \begin{bmatrix} \frac{2}{3}e^{2t} & \frac{1}{3}e^{2t} \\ \frac{1}{3}e^{5t} & -\frac{1}{3}e^{5t} \end{bmatrix}$$

$$\begin{aligned} \mathbf{X}_p(t) &= \begin{bmatrix} e^{-2t} & e^{-5t} \\ e^{-2t} & -2e^{-5t} \end{bmatrix} \int \begin{bmatrix} \frac{2}{3}e^{2t} & \frac{1}{3}e^{2t} \\ \frac{1}{3}e^{5t} & -\frac{1}{3}e^{5t} \end{bmatrix} \begin{bmatrix} 3t \\ e^{-t} \end{bmatrix} dt \\ &= \begin{bmatrix} e^{-2t} & e^{-5t} \\ e^{-2t} & -2e^{-5t} \end{bmatrix} \begin{bmatrix} \int (2te^{2t} + \frac{1}{3}e^t) dt \\ \int (te^{5t} - \frac{1}{3}e^{4t}) dt \end{bmatrix} = \begin{bmatrix} \frac{6}{5}t - \frac{27}{50} + \frac{1}{4}e^{-t} \\ \frac{3}{5}t - \frac{21}{50} + \frac{1}{2}e^{-t} \end{bmatrix} \end{aligned}$$

### 8.3.3.2 和 initial value problems 相結合

$$\mathbf{X}' = \mathbf{AX} + \mathbf{F} \quad \mathbf{X}(t_0) = \mathbf{X}_0$$

$$\mathbf{X}(\Phi\mathbf{C}\Phi^{-1}\mathbf{F}) + \int_{t_0}^t (\mathbf{A}^{-1}(\tau))(\mathbf{F})(\tau) d\tau$$

在此時，可改寫成定積分的型態

$$\mathbf{X}(\Phi\mathbf{C}\Phi^{-1}\mathbf{F}) + \int_{t_0}^t (\mathbf{A}^{-1}(\tau))(\mathbf{F})(\tau) d\tau$$

Since  $\mathbf{X}(\Phi)\mathbf{G} - \mathbf{X}(t_0) = \mathbf{0}$  thus  $\mathbf{C}\Phi\mathbf{X}^{-1}(t_0) = \mathbf{0}$

$$\boxed{\mathbf{X}(\Phi\mathbf{F}\mathbf{X}\Phi^{-1}\mathbf{F}^{-1}(t_0) - \mathbf{0}) + \int_{t_0}^t (\mathbf{A}^{-1}(\tau))(\mathbf{F})(\tau) d\tau}$$

### 8.3.4 Section 8.3 需要注意的地方

- (1)  $2 \times 2$  matrix 的 eigenvector 快速算法
- (2) 注意 undetermined coefficient 的方法和 Section 4.4 異同處
- (3) Variation of parameters 的部分，關鍵在是否能將公式背起來
- (4) 通常 undetermined coefficient 的方法會比較容易解  
而 variation of parameters 較複雜，但適用於任何情形
- (5) 同樣記得先算 complementary function (homogeneous 部分的 solution)，再算 particular solution

# Section 8.4 Matrix Exponential

## 8.4.1 Section 8.4 摘要

把 linear system 當成一般 1<sup>st</sup> order DE 來解

$$x'(t) = ax(t) \longrightarrow x(t) = ce^{at} \quad (\text{比較 Section 2-3})$$

$$x'(t) = ax(t) + f(t) \longrightarrow x(t) = ce^{at} + e^{at} \int e^{-at} f(t) dt$$

$$(1) \quad \mathbf{X}' = \mathbf{AX} \longrightarrow \mathbf{X}(t) = e^{\mathbf{At}} \mathbf{C}$$

$$(2) \quad \mathbf{X}' = \mathbf{AX} + \mathbf{F} \longrightarrow \mathbf{X}(t) = e^{\mathbf{At}} \mathbf{C} + e^{\mathbf{At}} \int e^{-\mathbf{At}} \mathbf{F}(t) dt$$

$$(3) \quad \mathbf{X}' = \mathbf{AX} + \mathbf{F} \longrightarrow \mathbf{X}(t) = e^{\mathbf{At}} e^{-\mathbf{At}_0} \mathbf{X}_0 + e^{\mathbf{At}} \int_{t_0}^t e^{-\mathbf{A}\tau} \mathbf{F}(\tau) d\tau$$

(With initial condition  $\mathbf{X}(t_0) = \mathbf{X}_0$ )

其中  $e^{\mathbf{At}}$  可以由 Laplace transform

$$e^{\mathbf{At}} = L^{-1} \left[ (s\mathbf{I} - \mathbf{A})^{-1} \right] \quad (\text{see page 580})$$

或 eigenvector-eigenvalue decomposition (see page 582) 算出

## 8.4.2 For Homogeneous Systems

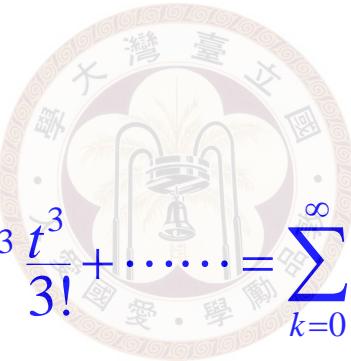

$$\mathbf{X}' = \mathbf{AX}$$

$$x'(t) = ax(t) \longrightarrow x(t) = ce^{at}$$

solution:  $\boxed{\mathbf{X}(t) = e^{\mathbf{At}}\mathbf{C}}$

$e^{\mathbf{At}}$  的定義

$$e^{\mathbf{At}} = \mathbf{I} + \mathbf{A} + \frac{\mathbf{A}^2 t^2}{2!} + \frac{\mathbf{A}^3 t^3}{3!} + \dots = \sum_{k=0}^{\infty} \frac{\mathbf{A}^k t^k}{k!}$$

$$\frac{d}{dt} e^{\mathbf{At}} = \sum_{k=1}^{\infty} \mathbf{A}^k \frac{t^{k-1}}{(k-1)!} = \sum_{h=0}^{\infty} \mathbf{A}^{h+1} \frac{t^h}{h!} = \mathbf{A} e^{\mathbf{At}}$$

$$h = k - 1$$

### 8.4.3 For Nonhomogeneous Systems

$$\mathbf{X}' = \mathbf{AX} + \mathbf{F}$$

solution: 
$$\mathbf{X}(t) = e^{\mathbf{At}}\mathbf{C} + e^{\mathbf{At}} \int e^{-\mathbf{At}} \mathbf{F}(t) dt$$

或

$$\mathbf{X}(t) = e^{\mathbf{At}}\mathbf{C} + e^{\mathbf{At}} \int_{t_0}^t e^{-\mathbf{A}\tau} \mathbf{F}(\tau) d\tau$$

比較 :  $x'(t) = ax(t) + f(t) \longrightarrow x(t) = ce^{at} + e^{at} \int e^{-at} f(t) dt$

with initial conditions  $\mathbf{X}(t_0) = \mathbf{X}_0$

$$\mathbf{X}(t) = e^{\mathbf{At}} e^{-\mathbf{At}_0} \mathbf{X}_0 + e^{\mathbf{At}} \int_{t_0}^t e^{-\mathbf{A}\tau} \mathbf{F}(\tau) d\tau$$

## 8.4.4 Computation of $e^{\mathbf{A}t}$

$$\mathbf{X}' = \mathbf{AX}$$

$$\mathbf{X} = e^{\mathbf{At}} \mathbf{C}$$

一定有這樣的 initial condition

$$\mathbf{X}(0) = \mathbf{C}$$

constant column  
vector

令  $\mathbf{X}(s)$  為  $\mathbf{X}(t)$  的 Laplace transform

$$s\mathbf{X}(s) - \mathbf{X}(0) = \mathbf{AX}(s)$$

$$(s\mathbf{I} - \mathbf{A})\mathbf{X}(s) = \mathbf{C}$$

$$\mathbf{X}(s) = (s\mathbf{I} - \mathbf{A})^{-1} \mathbf{C}$$

$$e^{\mathbf{At}} \mathbf{C} = L^{-1} [\mathbf{X}(s)] = L^{-1} [(s\mathbf{I} - \mathbf{A})^{-1}] \mathbf{C}$$

$$e^{\mathbf{At}} = L^{-1} [(s\mathbf{I} - \mathbf{A})^{-1}]$$

## Example 1 (text page 335)

$$\mathbf{A} = \begin{bmatrix} 1 & -1 \\ 2 & -2 \end{bmatrix} \quad \text{Determine } e^{\mathbf{A}t}$$

$$s\mathbf{I} - \mathbf{A} = \begin{bmatrix} s-1 & 1 \\ -2 & s+2 \end{bmatrix}$$

$$(s\mathbf{I} - \mathbf{A})^{-1} = \frac{1}{s(s+1)} \begin{bmatrix} s+2 & -1 \\ 2 & s-1 \end{bmatrix}$$

$$= \begin{bmatrix} \frac{2}{s} - \frac{1}{s+1} & -\frac{1}{s} + \frac{1}{s+1} \\ \frac{2}{s} - \frac{2}{s+1} & -\frac{1}{s} + \frac{2}{s+1} \end{bmatrix}$$

$$e^{\mathbf{A}t} = \begin{bmatrix} 2 - e^{-t} & -1 + e^{-t} \\ 2 - 2e^{-t} & -1 + 2e^{-t} \end{bmatrix}$$

殺雞焉用牛刀.....

複習 linear algebra 當中， $e^{\mathbf{A}t}$  的求法

(1) eigenvector-eigenvalue decomposition for  $\mathbf{A}$

$$\mathbf{A} = \mathbf{E}\mathbf{D}\mathbf{E}^{-1}$$

$$\mathbf{E} = [\mathbf{e}_1 \quad \mathbf{e}_2 \quad \mathbf{e}_3 \quad \cdots \quad \mathbf{e}_n]$$

$\mathbf{e}_1, \mathbf{e}_2, \mathbf{e}_3, \dots, \mathbf{e}_n$  皆為  $\mathbf{A}$  的  
eigenvectors, 皆為  $n \times 1$  的 column

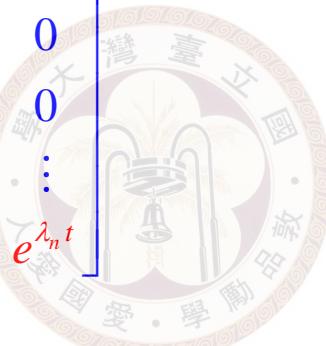

$$\mathbf{D} = \begin{bmatrix} \lambda_1 & 0 & 0 & \cdots & 0 \\ 0 & \lambda_2 & 0 & \cdots & 0 \\ 0 & 0 & \lambda_3 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & \lambda_n \end{bmatrix}$$

$\lambda_1, \lambda_2, \lambda_3, \dots, \lambda_n$  為  $\mathbf{e}_1, \mathbf{e}_2, \mathbf{e}_3, \dots, \mathbf{e}_n$   
所對應的 eigenvalues

$$\mathbf{A} = \mathbf{E} \mathbf{D} \mathbf{E}^{-1}$$

$$e^{\mathbf{A}t} = \mathbf{E} e^{\mathbf{D}t} \mathbf{E}^{-1}$$

$$e^{\mathbf{D}t} = \begin{bmatrix} e^{\lambda_1 t} & 0 & 0 & \cdots & 0 \\ 0 & e^{\lambda_2 t} & 0 & \cdots & 0 \\ 0 & 0 & e^{\lambda_3 t} & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & e^{\lambda_n t} \end{bmatrix}$$

例如，Example 1 當中

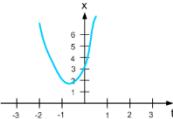

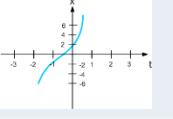

$$e^{\mathbf{D}t} = \begin{bmatrix} 1 & 0 \\ 0 & e^{-t} \end{bmatrix} \quad \mathbf{E} = \begin{bmatrix} 1 & 1 \\ 1 & 2 \end{bmatrix} \quad \mathbf{E}^{-1} = \begin{bmatrix} 2 & -1 \\ -1 & 1 \end{bmatrix}$$

## 8.4.5 注意

- (1) 本節可以解的問題，用 Sections 8-2, 8-3 的方法也可以解
- (2) 熟悉公式和  $e^{\mathbf{A}t}$  的計算
- (3) 使用 eigenvalue-eigenvector decomposition 的方法時，別忘了將  $\lambda$  變成  $e^{\lambda t}$
